## Review Problem Set #7

## Concepts for Problem Set #8

# Markov Chains

Suppose we observe a random sequence  $(x_n)_{n=1}^{\infty}$ .

By chain rule, we can **always** write the joint density as:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 \mid x_1)p(x_3 \mid x_1, x_2) \cdots p(x_n \mid x_1, x_2, \dots, x_{n-2}, x_{n-1})$$

# Markov Chains

Suppose we observe a random sequence  $(x_n)_{n=1}^{\infty}$ .

By chain rule, we can **always** write the joint density as:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 \mid x_1)p(x_3 \mid x_1, x_2) \cdots p(x_n \mid x_1, x_2, \dots, x_{n-2}, x_{n-1})$$

**Markov chains** are special sequences whose joint density simplifies to:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 \mid x_1)p(x_3 \mid \cancel{x_1}, x_2) \cdots p(x_n \mid \cancel{x_1}, \cancel{x_2}, \dots, \cancel{x_{n-2}}, x_{n-1})$$

# Markov Chains

Suppose we observe a random sequence  $(x_n)_{n=1}^{\infty}$ .

By chain rule, we can **always** write the joint density as:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 \mid x_1)p(x_3 \mid x_1, x_2) \cdots p(x_n \mid x_1, x_2, \dots, x_{n-2}, x_{n-1})$$

**Markov chains** are special sequences whose joint density simplifies to:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 \mid x_1)p(x_3 \mid \cancel{x_1}, x_2) \cdots p(x_n \mid \cancel{x_1}, \cancel{x_2}, \dots, \cancel{x_{n-2}}, x_{n-1})$$

That is, Markov chains satisfy

$$p(x_{n+1} \mid x_{1:n}) = p(x_{n+1} \mid x_n)$$

# Markov Chains

Suppose we observe a random sequence  $(x_n)_{n=1}^{\infty}$ .

By chain rule, we can **always** write the joint density as:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 | x_1)p(x_3 | x_1, x_2) \cdots p(x_n | x_1, x_2, \dots, x_{n-2}, x_{n-1})$$

**Markov chains** are special sequences whose joint density simplifies to:

$$p(x_1, x_2, \dots, x_n) = p(x_1)p(x_2 | x_1)p(x_3 | \cancel{x_1}, x_2) \cdots p(x_n | \cancel{x_1}, \cancel{x_2}, \dots, \cancel{x_{n-2}}, x_{n-1})$$

That is, Markov chains satisfy

$$p(x_{n+1} | x_{1:n}) = p(x_{n+1} | x_n)$$

In words:

The future is conditionally independent of the past given the present.

## Example: Simple random walk

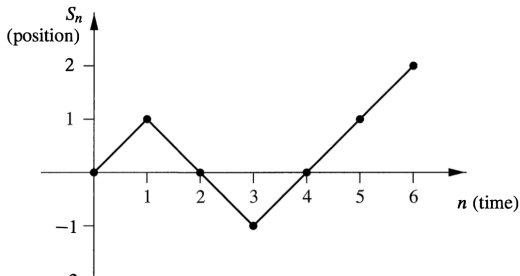

For timesteps  $n = 1, 2, 3, \dots$ , let

$$X_n = \begin{cases} 1, & \text{with probability } p \\ -1, & \text{with probability } q = 1 - p \end{cases}$$

Then a **simple random walk** (in one dimension) is given by

$$S_n = S_0 + \sum_{i=1}^n X_i,$$

where  $S_0$  is the starting position.

## Group exercises - Problem Set 8

1. (6.1.2) A die is rolled repeatedly. Which of the following are Markov chains? For those that are, supply the transition matrix
  - (a) The largest number  $X_n$  shown up to the  $n$ -th roll.
  - (b) The number  $N_n$  of sixes in  $n$  rolls.
  - (c) At time  $r$ , the time  $C_r$  since the most recent six.
  - (d) At time  $r$ , the time  $B_r$  until the next six.
2. (Sec 6.2) Show that a simple random walk is periodic with period 2. Then show that a simple random walk is recurrent if  $p = \frac{1}{2}$  but transient if  $p \neq \frac{1}{2}$ .
